

TheraBase Case

Dentistry courtesy of Dr. Raul Euan DDS

1 After cavity preparation, all water was removed using a stream of air, leaving the surface visibly moist. TheraCal LC was applied on small pulp exposure and light-cured for 20 seconds.

2 TheraBase was applied to the dentin surface of the prepared cavity directly from the dispensing syringe.

3 TheraBase was light cured for 20 seconds. If desired, TheraBase can be allowed to self-cure for 4 minutes.

4 A selective-etch bonding technique was used to condition the surface of the preparation. Any bonding technique can be applied.

5 All-Bond Universal® was applied following manufacturer's instructions.

6 Restorations were filled with a light-cure composite material following manufacturer's instructions.

TheraBase™

BASE AND LINER. THE THERA WAY.

Ordering Information

TheraBase Single Syringe Pack.....H-35001P
1 Syringe TheraBase (8g), Accessories, Instructions

Auto-Mix Cannula Tips (30).....X-81270P

MC-2038TB

Rx Only

New to the THERA family

TheraBase is a dual-cure, calcium and fluoride releasing, self-adhesive base/liner. Utilizing the THERA technology, TheraBase chemically bonds to tooth structure, and releases and recharges calcium and fluoride ions.¹ TheraBase's calcium release generates an alkaline pH which promotes pulp vitality.² It is a dual-cured material that will polymerize even in deep restorations where light cannot reach.

TheraBase is stronger and more durable than other base materials, glass ionomers and resin-modified glass ionomers.* Additionally, it is radiopaque allowing for easy identification on radiographs, providing a quick and effective diagnosis.

TheraBase Benefits

Releases Calcium and Fluoride
Continuous release of Calcium and Fluoride ions¹

Easy to use
Auto-mix, dual-syringe provides a consistent mix for immediate delivery with zero to minimal waste of material.

Self-adhesive
No bonding agents required - Save time and money

Dual-Cured
Material will fully cure even in deep restorations where light cannot reach.

High flexural strength
Stronger and more fracture resistant

Alkaline pH
Generates an Alkaline pH (pH=11*) in minutes, which promotes pulp vitality²

High compressive strength
Absorbs shock and stress from occlusal forces without fracturing

High degree of conversion
Ensures enhanced physical properties

Contains MDP
Contains the adhesion promoting monomer MDP, ensuring reliable and optimal bond to dentin³

Radiopaque
TheraBase is radiopaque allowing for identification on radiographs and effective diagnosis.

THERA HYDROPHILIC MATRIX

BISCO has developed a hydrophilic matrix that allows for ion exchange. Previous or traditional resin matrices have been hydrophobic, but BISCO's matrix allows for ion exchange as water goes into the matrix, reacts, and calcium hydroxide ions and fluoride ions are released.

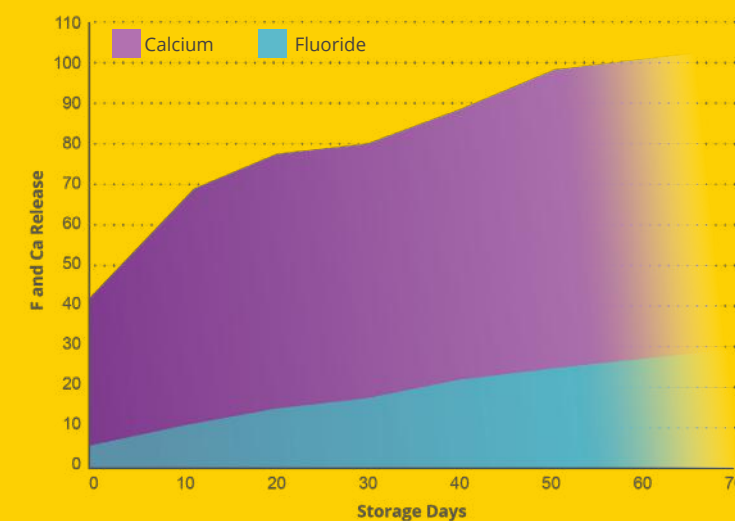

At the calcium-rich interface between TheraBase and the dentin, an alkaline pH environment is created.

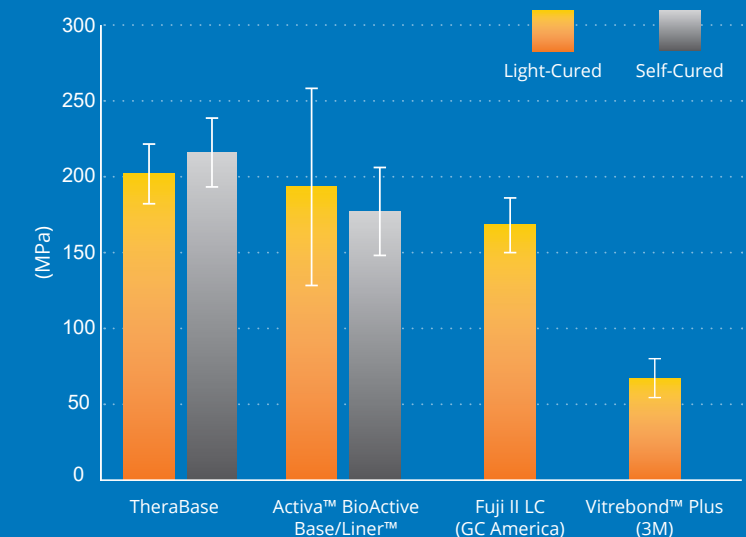

In deep restorations and when pulp exposure occurs, BISCO recommends the use of TheraCal LC for direct and indirect pulp capping and as a liner.

Both TheraBase and TheraCal LC can be used together in a sandwich technique case scenario for optimum calcium and fluoride release benefits and ultimate pulp protection.

TheraBase Continuous Fluoride and Calcium Release¹

Compressive Strength

Trademarks are property of their respective manufacturers. Fuji II LC and Vitrebond Plus are light-cured only materials.
